Horizon 7 Network Ports with All Connection Types and All Display Protocols

All ports are shown, but only a subset are normally required depending on the components deployed and display protocols in use. See the companion VMware Horizon 7 Network Ports document for more detail and information on ports.

- Arrows indicate direction of traffic (source and destination).
- Ports shown are destination ports.
- A single View Connection Server cannot simultaneously handle both non-tunneled and tunneled connections. To achieve both, multiple View Connection Servers would be deployed. Only one is shown for illustrative purposes.
- Unified Access Gateway does not require pairing with a View Connection Server.
- Note: Network ports shown for supporting infrastructure are not exhaustive. This diagram primarily illustrates connectivity between VMware components.
